

# Koya Talent Proposals: System One-Pager

**Owner:** Mide Giwa (olamidegiwa21@gmail.com)

**Application:** [aat-c3-week-3-proposal-app-sigma.vercel.app](#)

**Database:** Neon console

**Last updated:** September 11, 2026

## Purpose & Success Criteria

**Who it's for:** the sales team preparing client proposals after discovery calls, and the internal approver who signs off before anything reaches a client.

**Problem it solves:** proposals were written by hand from notes, old templates, and memory. That was slow to produce, and quality depended heavily on who wrote it.

**What it does:** turns discovery-call intake into a drafted proposal, lets the salesperson review and revise it, routes it through internal approval, then generates and sends the client-ready document, with everything logged centrally.

**What changes if it works:** proposal turnaround drops from hours to minutes, every proposal follows a consistent, professional structure, and nothing reaches a client without a human sign-off.

How success is measured: all seven required test scenarios pass (normal generation, missing-information handling, use of supporting material, section regeneration, no send without approval, delivery and logging, and clear failure handling), and a salesperson can go from intake to a sent proposal without leaving the app.

## How It Works

A salesperson fills in an intake form, and Claude generates a structured, multi-section draft, flagging anything it doesn't have enough information for rather than guessing. The salesperson can edit or regenerate any single section without losing the rest. Submitting for review notifies an approver, and the proposal cannot be sent until it's approved. Once approved, the app builds a client-ready PDF and can email it directly to the client. Every step along the way, including generation, edits, the approval decision, the send, and any failure, is written to an audit trail attached to the proposal.

## How to Use It

1. Sign in with your account (salesperson or approver).
2. Salesperson: click "New Proposal," fill in the intake fields, attach any supporting material, and click Generate.
3. Review the draft section by section: edit text directly, or click Regenerate on a section that needs another pass.
4. Click Submit for Review to send it to an approver.
5. Approver: open the proposal and choose Approve, Request Changes, or Reject.
6. Once approved, click Send to Client. The app emails the PDF and marks the proposal Sent.
7. Check the Proposals list anytime for status, current owner, and the full history of any proposal.
